

Crowchild Trail in the road network

Crowchild Trail plays an important role in connecting people to key destinations. As a skeletal road, it is meant to move people safely and efficiently, carry large amounts of vehicle traffic and move goods across the city. It was first identified as a skeletal road in 1959.

Commuter Traffic

Crowchild Trail is the primary north-south link on the west side of Calgary. When functioning properly, it will discourage people from short-cutting through bordering communities.

Pedestrian Connections

Calgary's communities and parks are connected by a network of pedestrian and cycling paths. Crowchild Trail provides a direct connection to the regional paths on the north and south sides of the Bow River.

Primary Route for Transit, HOV and LRT

The plan is to have frequent, fast and reliable transit, every 10 minutes, 15 hours a day, 7 days a week.

Goods Movement

Crowchild Trail plays an important role in moving goods in a reliable and efficient way to key destinations city-wide.

Emergency Services

Crowchild Trail serves as a vital route for the delivery of health and emergency services for Calgarians because of its connection to key destinations across the city.
