Commercial and Institutional Building Energy Benchmarking Program

Last Updated on May 31, 2021

Full Disclosure When you choose full disclosure, these building energy performance metrics will be publicly displayed on the Energy Performance Map:

Company Name	Site EUI (GJ/m ²)
Building Use	Source EUI (GJ/m ²)
Gross Floor Area (m ²)	Total GHG Emissions (kg CO ₂ e)
Construction Date (Year)	GHG Emissions Intensity (kg CO ₂ e/m ²)
ENERGY Star Score (1-100)	

By disclosing this data, your organization assists in the following:

- Sets a baseline of actual performance versus expected performance, allowing energy efficiency efforts to progress in the right direction.
- Allows The City of Calgary to monitor how buildings across the city are performing, assists in assessing the impacts of current energy and emission policies, helps plan future policies and regulations, and determines acceptable levels of building energy performance based on building type.
- Improves public understanding of building performance – community members can make informed decisions and choose to use spaces that align with their social, economic and environmental values.
- Establishes eligibility for the future awards and recognition program(s).

Aggregate Disclosure When you choose this option, you will provide your building energy performance data to the program without public disclosure.

Your building's data will be included in the program database and will be used to anonymously populate the energy performance histograms on the public map; however, your individual building and property information will not be identified.

Hybrid Disclosure This option allows you to select some of your buildings for full disclosure and others for aggregate disclosure.
